

PolySystems, Inc.

February 15, 2010

PolySystems has just released Version 5.0 of its Health Suite. This new version supports Compiled User Formulas for valuations and projections (HealthMaster and HealthDelphi).

PolySystems first developed user formulas about 15 years ago. User formulas are typically used when they are the most direct, understandable and concise way to describe processing to a system.

Compiled User Formulas take advantage of C# syntax, which allows for easier coding and shorter—often much shorter—run times. Version 5.0 is also backward compatible so that any user formulas written prior to Version 5.0 will run accordingly.

Compiled User Formulas will make your life easier. We are very happy to make them available to you. Access to this new feature requires that you roll-up your systems to Version 5.0. PolySystems can help you get started with this process. Please contact me and let me know how we can help you.

With the introduction of Version 5.0 of our Health Suite, PolySystems will no longer support Version 4.6. Any future fixes will be incorporated into Versions 4.7 and 5.0 only. All new features will be incorporated into Version 5.0 only.

Please let me know if you have any questions.
